The approved mine ventilation plan, approved 8/09/09 and re-approved 1/22/10 was not being followed in the tailgate entries of the longwall panel. The air was going outby in the No. 5-7 entries from the longwall face (return air) to the mouth of the section instead of intake air going inby from the mouth of the section to the longwall tail. The regulator at survey station 22412 was not present and instead was a permanent stopping blocking intake air from ventilating the tailgate entries.
